# The Mercury In Your Mouth: The Truth About "Silver" Dental Fillings

## Synopsis

Book by Quicksilver Associates

## Book Information

Paperback: 189 pages

Publisher: Quicksilver Pr (September 1997)

Language: English

ISBN-10: 096438700X

ISBN-13: 978-0964387003

Product Dimensions: 0.5 x 6.8 x 9 inches

Shipping Weight: 8.8 ounces

Average Customer Review: 3.9 out of 5 stars 7 customer reviews

Best Sellers Rank: #1,533,915 in Books (See Top 100 in Books) #33 in [Books > Medical Books > Dentistry > Dental Materials](#)

## Customer Reviews

Book by Quicksilver Associates

It's hard for me to believe that the two people who wrote negative reviews actually read the book. The studies seem very well done, the conclusions solid. The ADA states that mercury is safe; the evidence indicates otherwise. I can understand that dentists would be reluctant to accept this; it must be very difficult to consider the possibility (and it seems a hell of a lot more than possible) that you have spent your life and livelihood doing immense damage to people by placing amalgam fillings in their mouths. The evidence shows 1) mercury leaks 24/7 from amalgam fillings, 2) the mercury collects throughout the body, 3) mercury damages the immune system, 4) mercury is very likely the cause, or at the very least a contributing cause, of multiple poorly understood human diseases, such as MS, ALS, CFIDS, fibromyalgia, arthritis, autism, Alzheimer's and many others. No wonder animals don't get these diseases. They don't have amalgam fillings or other heavy mercury exposure. Think about this, folks. Does it make sense that the same amalgam placed in your mouth must, when removed from your mouth, be disposed of as toxic waste? The only safe place for amalgam is in your mouth? Next time you break an old thermometer, don't bother dealing with the mercury as hazardous waste. Just put it in your mouth; it'll be quite safe there :)

This is an excellent book. I just wanted to go on record refuting the dentist who wrote a review

slamming this book, saying that no mercury leaks out of silver fillings, and accusing the author of looking for financial gain in writing the book. First, the peer-reviewed science is conclusive. Mercury in dental fillings slowly leaks into your body, causing many diseases in genetically susceptible people. How this manifests depends on your genetics. Some people aren't hurt by the "small amounts" leaking out. Others get Alzheimer's, or MS, or chronic fatigue, or food allergies, or heart disease, etc. (the list goes on and on). The dangers are real, and this dentist does a disservice to the health of all by writing a poor review of this book. Second, the author of this book isn't looking for financial gain -- she was getting symptoms of Multiple Sclerosis when she traced it back to her mouth full of "silver" fillings. Even after having them replaced, and getting better, she was incredulous that the mercury in the fillings were really what caused the problem, so she embarked on a several-year research project talking with experts on the issue, the culmination of which is this very useful book -- which confirms that mercury is very dangerous. If you want some hard-won knowledge that could save your health, read this book.

It's surprising to me that so many dentists and otherwise thoughtful people are willing to ignore the evidence on dental toxicity when we have the following givens regarding mercury: (1) it's highly toxic for humans, (2) it does leech from fillings (which the ADA used to deny, but now admits) and (3) it accumulates in the body over time. Doesn't it seem like the dental industry needs to take a more serious look at this and not dismiss it out of hand so readily? The amount of peer reviewed literature critical of mercury fillings (much of it from scientists and specialists outside the dental industry) should make the dental profession stop and re-evaluate their position. It's sad that the potentially dangerous long term effects on people's health is not more of an issue for a majority of dental professionals. Books like this one and Hal Huggin's books provide a basis for finding the literature. Peer reviewed articles can be found on the internet, as well. And while we're on the subject of what really is science and what isn't, I'd like to lay to rest an argument I've seen from the "pro-amalgam" group way too many times, i.e., that the mercury in the amalgam is "chemically bonded" to the other metals in the amalgam. This statement is not just questionable, it is scientifically wrong. Did these people not have junior high chemistry? Amalgam is an alloy, not a compound. The mercury is not chemically bonded to the filling in any way (and anyhow, studies have shown and the ADA now admits that mercury leeches off fillings). What will 20, 30, 40 years of mercury contamination 24 hours a day do to you? Scare tactics? Make up your own mind. Read the book.

It's frustrating that otherwise intelligent people ie. dentists, believe that by mixing the most toxic

metal known (mercury) with other toxic metals (copper, silver, zinc, tin) and then placing this mixture in people's teeth, results in a harmless non-corroding filling. Yet dental guidelines insist that scrap dental amalgam is mixed in airtight containers and disposed carefully so as not to contaminate the environment. So what is it - safe or not safe ? That mercury is there 24x7 in your mouth, leaking into your intestines. Yet we are told to limit our consumption of tunafish to no more than once a week due to mercury contamination. Who are the lying quacks ? Go figure.

If you have chronic health problems, then give this book a look. This book covers many important aspects of mercury amalgam fillings: history, research, symptoms, removal, and detoxification. It will make you wonder why the U.S. hasn't joined Sweden, Germany, and Austria in banning mercury amalgam fillings
